                                                                                                                                                                                                                                                                        used to demonstrate Bi-PASA. In Bi-PASA, 2 outer primers (P and Q) and 2 inner primers (A and B) are used. A and B are each specific for different alleles. P is complementary to the antisense strand of both alleles in a region upstream of the sequence difference (mismatch). Q is complementary to the sense strand of both alleles in a region downstream of the mismatch. In heterozygotes, 3 segments are amplified: a segment of size AQ resulting from 1 allele, another of size PB resulting from the 2nd allele, and a combined segment of size PQ. In homozygotes, segment PQ and either segments AQ or PB amplify. P, Q, A and B primers for the FV gene are given in AAF30550-74. Under optimal PCR conditions, the relative yield of DNA products obtained using the present primer is low, as indicated by a weak DNA band on agarose gels. Bi-PASA provides a one-tube method for simultaneously differentiating homozygotes and heterozygotes. It can detect small deletions and insertions as well as single base changes. Bi-PASA is also used to perform population screening, haplotype inexaction in a single base in a single
                                                                                                   Query Match

Its name indicates an A primer for FV (F5), the 5' end beginning at base 254 of exon 10 of the FV gene (see AF30549) and proceeding downstream for 23 bases. It also includes a G10 tail, and the 3' base is a mutated A nucleotide. A mutation in exon 10 of the FV gene is associated with venous thromboembolism. Detection of this mutation was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of human Factor V (FV) gene primer A4 F5(254)-23D, used in bi-directional PCR amplification of specific alleles (Bi-PASA). Its name indicates an A primer for FV (F5), the 5' end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Conducting a bi-directional polymerase chain reaction amplification of specific alleles, involves amplifying DNA containing one or both of two alleles using an outer pair of primers and an inner pair of primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Factor V; human; FV gene; bi-directional PCR; Bi-PASA; mutation;

                                                                                                                                                                          The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the genes, CC their use in the discovery of novel antibiotics, the essential genes CC themselves and the encoded proteins. The prokaryotes used are Escherichia C coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also CC useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify CC proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The can used to acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence is a PCR primer used to isolate an cesential cellular proliferation gene of the invention. Note: The consecution, but was obtained in electronic format directly from WIPO cesential of the printed consecution.

Firefly luciferase catalyses the oxidation of luciferin with the resultant production of light. Luciferases (both wild type and recombinant) lose activity quite rapidly when exposed to temperatures in excess of 30 degrees celsius. The present linvention relates to luciferase enzymes comprising specific mutation which increase its thermostability. Also included in the invention are: 1) a vector comprising a nucleotide sequence encoding the mutant luciferase; 2) a cell transformed with the vector and, 3) a plant comprising the transformed cells; The luciferase enzyme is useful in bioluminescent assays, where it uses the substrate D-luciferin (4,5-dhydro-2-(6-hydroxy-2-benzothiazolyl)-4-thiazole
AAA75311-41 and AAA75393-A75402 are derived from the origin of replication of the pBR322 plasmid. The nucleic acid fragments are as probes and primers for detecting sequences derived from the ori replication of pBR322 or vectors (or their fragments) that contain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mutant luciferase enzyme comprising specific mutations which increase thermostability, useful in bioluminescent assays.

                                                                                                                   The present invention relates to a method for the locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles. The method is useful for subtyping or typing of HLA class 1 alleles. The present sequence is an amplification primer used in the method
                                                                                                                                                                                                                       Locus-specific, separate amplification of exon 2, exon 3, and/or exon of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles using defi primer sets, useful for subtyping or typing of HLA Class I alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequences. They are particularly used to monitor the presence of gene therapy vectors (used to deliver therapeutic genes or proteins, antise sequences or ribozymes), e.g. for determining disappearance of the vector, for adjustment of treatment, or for timing of new treatments. They can also be used to screen foods and cosmetics for the presence derived materials from genetically modified organisms
                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                   09-APR-1999;

The reaction may also contain a non-extendable oligonucleotide (i.e. a blocking sequence) complementary to the internal control sequence, which functions as a negative control. The method can be used for quantitating nucleic acid amplification of control DNA in the presence of, and concurrently with, nucleic acid amplification of known or unknown target DNA. Suggested uses include tracking of target sample extraction, isolation and purification, for amplification of low copy number genes, for allelic discrimination of polymorphic samples or pathogen detection. Primers ARA40587 are used to detect NPTII RNA in transgenic cotton plants by the method of the invention. This primer was used as a self-quenching internal positive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Method of conducting nucleic acid amplification control reactions used for e.g. carrying out real time monitoring of nucleic acid amplification reactions and positive and negative control tests.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Reporter; quencher; probe; assay; internal control agent; primer; PCR; detection; measurement; amplification; blocking sequence; copy-number; quantitation; allele; discrimination; polymorphism; pathogen; NPTII; s
                                                                                                                                                                                                                                                                                                                                                            Sequence 23 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            assays more meaningful by the addition of internal control agents. Primers for a target and an internal control sequence are labelled with

Luciferases (both wild type and recombinant) lose activity quite result among to temperatures in excess of 30 degrees celsius. The present invention relates to luciferase enzymes comprising specific mutation which increase its thermostability. Also included in the invention are: 1) a vector comprising a nucleotide sequence encoding the mutant luciferase; 2) a cell transformed with the vector and, 3) a plant comprising the transformed cells; The luciferase enzyme is useful in bioluminescent assays, where it uses the substrate D-luciferin (4,5-dihydro-2-(6-hydroxy-2-benzothiazoly1)-4-thiazole
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 23 BP; 2 A; 8 C; 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a PCR primer used in the preparation thermostable mutant luciferase enzyme from Photinus pyralis (

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         strand and a region which is heterologous to the target gene for introducing a predetermined alteration into a target gene of a cukaryotic cell, other than a yeast or fungus. The chimeric polynucleotide contains both RNA and DNA residues in the first strand and solely DNA residues in the second strand; wherein the strands are Watson-crick paired and are linked by an oligonucleotide so that the polynucleotide has atmost a single 3' and 5' end. The ribo-deoxynucleic acids can be used for specifically introducing alterations into a target nucleic acid. They can be used for e.g. the production of transgenic animals. The present sequence represents a control vector used along with a chimeric vector which was constructed to direct a mutation in the NIH 3T3 cells. The transformation of the NIH 3T3 cells results in selectable alteration in
              library targeted to a selected RNA transcript. The methods can be used for identifying antisense agents and for identifying target sites for antisense-mediated inhibition of a selected gene. The use of a direct library for target site selection significantly simplifies the screening process, since only very small libraries need be prepared and assayed. AAZ23765-Z23767 represent multiple cloning site DNA regions used in the
                                                                                                                                                                                                                                                                   selected
                                                                                                                                                                                                                                                                                       Production of antisense libraries, used for identifying antisense and for identifying target sites for antisense-mediated inhibition

                                                                                                            Oligonucleotides AAX15540-46 are used in the course of the invention. specification describes a cellulase enzyme designated SCE-3. The cellulase is used in the methods of the invention for treatment of containing fibres, for bleaching denim-dyed cellulose-containing fibres, for eliminating fluffs from cellulose-containing fibres, for weight loss treatment of cellulose-containing fibres, for weight loss treatment of cellulose-containing fibres and deacetylated triacetate rayon, all by contacting the preparation with such fibres. It is useful in the textile and related industries
                                                                                                                                                                                                                                                                                                                      Sato Y,

                                                                                                                                                                       The sequences given in AAQ87854-69 are probes which were used in the CC isolation of the component B gene. The probes are targetted to various CC regions of the gene including the promoter, the three exons and intron 2. CC These probes were used to screen a human genomic library. The component B gene contains three exons and two introns. Exon 1 is 84 bp and contains CC 26 bases of untranslated mRNA. It encodes 19 amino acids of the putative signal peptide and is separated from exon 2 by an intron of 410 bp. Exon CC 2 is 120 bp and codes for 3 amino acids of the putative signal sequence CC and 17 amino acids of the mature protein. It is separated from exon 3 by an intron of abbout 550 bp. Exon 3 is 326 bp and encodes the C-terminal CC 44 amino acids of component B, and 192 bases of untranslated RNA which CC contains a poly-A signal 14 bp upstream of the 3' processing site. CC component B is a low molecular weight protein which may be isolated from CC so has antiinflammatory, anticoagulant and/or antitumour activities. It compared to treat conditions associated with altered levels of CC TGF-alpha, eg. behavioural or hormonal disturbances and angiogenesis. See CC also AAQ87876-78. (Updated on 25-MAR-2003 to correct PN field.) (Updated CC on 75-AMR-2007 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 1291

A specific application is diagnosis of copper toxicosis (CT). The inventior can also be used to create a genetic map of the canine genome; to generate breed-specific profiles; to establish paternity and to identify dogs from DNA fingerprints. The method provides rapid analysis of the target sequences from only a small sample of DNA. Diagnosis can be done at any time in the dog's life. The present sequence is that of a PCR primer of the invention.

The method is for for detecting a mutation from a non-mutated sequence of a target polymucleotide (TP) in a sample, by using a mismatch binding protein (MBP), comprises: (a) providing a non-mutated and mutated TP; (b) forming duplex of the non-mutated and mutated TP; (b) forming duplex of the single strands of TP in (a); (c) adding a single strand binding protein to the polymucleotide from (b); (d) incubating MBP with an activating agent; (e) adding the incubated MBP from (d) to the polymucleotide from (c), so that MBP binds to the duplex formed by one non-mutated and one mutated single strand of TP; and (f) detecting the presence of any MBP bound to TP. The method may be used for early diagnosis of cancer. Binding of MBP to single strands is inhibited by the single strand binding protein. By activating MBP with an activator, before addition to the sample, binding to double strands lacking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20 BP; 6 A; 11 C; 1 G; 2 T; 0 U; 0 Other;

This sequence represents a PCR primer for a proto-oncogene/oncogene, and CC was used to test the method of the invention. The method is for CC increasing synthesis of nucleic acid (1) in a cell by exposing it to CC ultrasound, where (1) is: (a) an endogenous sequence (Ia) encoding a CC stress or repair protein; or (b) an introduced exogenous sequence (Ib). CC The method is specifically used therapeurically: (i) to treat phenylketonuria (following introduction of [Ib) for phenylketonuria (following introduction of [Ib) for phenylalanine (CC iii) to increase production of IL-2, particularly associated with CC (iii) to increase production of IL-3, particularly associated with CC (antural killer cells; and (iv) for treating cancer by administering a CC sequence antisense to initiation factor 3 and/or tRNA synthase. More CC complete chromosomes, for delivery (in vivo, in vitro or even CC complete chromosomes, for delivery (in vivo, in vitro or expenditions, e.g. acquired immune deficiency syndrome, autoimmune diseases, chronic viral cinfections, haemophilia, cystic fibrosis, and cancer.                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence is a primer for a human or mammalian DNA replication origin CC consensus sequences of the invention, designated alphaconsensus.

Administration of the consensus sequence or an anti-gene (comprising a CC double stranded copy of the consensus) is used to inhibit DNA replication in vivo or in vitro. The consensus sequences can also be inserted into an CC expression vector, used subsequently for in vitro transfection of CC mammalian cells, to control initiation of DNA replication. They can also be used used to maintain circular plasmids that are capable of semi-cC conservative replication in proliferating mammalian cells, or inserted into mammalian or human artificial chromosome vectors for gene therapy. Particularly, they are used to create shuttle vector constructs for CC chromosomal function. The consensus sequence can be combined with cloned CC chromosomal function. The consensus sequence can be combined with cloned CC chromosomal through control of the consensus sequence can be combined with cloned CC chromosomes and maintained as bacterial plasmids, circular or linear, large or small yeast artificial chromosomes (YACs) or as episomal
                                                                                                                                                                                                                                                                                                                            Query Match

The method may be used for early diagnosis of cancer. Binding of MBP to single strands is inhibited by the single strand binding protein. By activating MBP with an activator, before addition to the sample, binding to double strands lacking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Method for detecting mutation(s) by mismatch binding protein - useful separating mutation from non-mutated target polynucleotide in sample, used in early diagnosis of cancer.

                                                                                                                                                                                                                                                                                                                        CC containing a mutated codon. The method involves: either cleaving a human CC containing a mutated codon. The method involves: either cleaving a human CC subject's genomic DNA with a restriction enzyme to produce DNA fragments CC and treating the fragments to obtain single-stranded DNA molecules or cisolating the subject's polyA+ mRNA; contacting the single-stranded DNA CC molecules or polyA+ mRNA under hybridising conditions with a labelled CC synthetic DNA molecule, optionally bound to a solid support, comprising CC 12-20 nucleotides, where the synthetic DNA molecule is 5'-B-Q-D-3' in the CC case of single-stranded DNA or is complementary to 5'-B-Q-D-3' in the CC case of polyA+ mRNA, B = 0-9 nucleotides having a sequence complementary to a sequence in the activated ras gene 5' of the mutated codon, D = 0-12 nucleotides having a sequence complementary to a sequence in the activated ras gene 5' of the mutated codon, D = 0-12 nucleotides having a sequence complementary to a sequence in the activated ras gene 3' of the mutated codon, provided that B and D contain CC atotal of at least 9 nucleotides, and Q is complementary to the mutated codon; treating the resulting hybridised molecules under conditions CC permitting only fully complementary molecules under conditions CC probe used for detecting the activated N-ras gene when the mutated codon codo position 12 and has a single base substitution in the first or CC second nucleotide position so that it encodes an amino acid other than CC and other than code and other than CC and other tha
                                                                                                                                                                                                         Query Match

Microsatellite markers based on hypervariable genomic fragments, from CC Triticum aestivum (wheat) or the tribe Triticeae, consist of a sequence CC tagged site (STS), defined by 2 specific primers (of mean size 17-23 CC bases) that flank a microsatellite sequence at both ends, which can be CC amplified to polymorphisms (PCR products of different sizes). The CC or tetra-nucleotide sequences, combination microsatellite sequences or an imperfect sequence in which individual bases are mutated. The CC microsatellite markers can be used for genetic manlysis of hexaploid and tetraploid forms of wheat and for genetic mapping or labelling of CC monogenic and polygenic properties, and for their selection; for CC analysing relationships and identifying varieties; and for evaluating CC varietal purity, hybrid identification and plant growth. The markers can differentiate between almost all European wheat lines and show a higher CC can be detected by PCR, so large numbers of samples can be analysed can be detected by PCR, so large numbers of samples can be analysed CC easily (e.g. several hundred per day). Microsatellite marker-related CC polymorphisms are stably inherited so can also serve as genetic markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

They may also be used to elucidate mechanisms of growth inhibition and apoptosis. Introduction of the second (upstream) ClaI site greatly reduces the chance of producing undigested DNA genome and increases the chance of generating fully cut DNA (i.e. redn. of parental genomic background). The vectors can be produced without the use of a plasmid-based vector, and infect breast cancer cells far more efficiently than bone marrow cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Microsatellite marker; hypervariable genomic fragment; Triticum ae wheat; Triticeae; sequence tagged site; STS; primer; PCR; amplify; polymorphism; genetic analysis; hexaploid; tetraploid; mapping; ss

                                                                                                                                                                                                                                                 Primer pairs UGT184f (AAT73571) and UGT184r (AAT73572), UGT197f (AAT73573) and UGT197r (AAT73573) and UGT184r (AAT73575) and UGT172 (AAT73573) were used to amplify sequence-tagged sites (STS) from Pennisetum genomic DNA. The primers were designed from sequences cloned from a BC3 clonal line K169-46 library. The STS can be used as molecular markers for the identification of Pennisetum apomixis genes. Such genes, esp. from Pennisetum squamulatum, can be transferred to pearl millet to provide apomictic plants useful as forage or grain cultivars or for development of true- breeding hybrids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Transgenic apomictic plants, e.g. pearl millet, squamulatum apomixis gene(s) - useful as forage to develop true-breeding hybrids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Apomixis gene; true-breeding; pearl millet; molecular marker; probe; hybrid seed; transgenic plant; Pennisetum squamulatum; sequence stagged site; STS; polymerase chain reaction; PCR; primer;

The GS sequences (T19001-T26837) were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. The primers T41233-4 amplify clone pm2780 which comprises the GS HUMGS000976 (T19976), located on chromosomes 14 and 16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Single-stranded DNA for identifying gene signatures - isolated from 3'-directed human cDNA library that reflects relative abundance of corresp. mRNA in specific human tissues.
                                        Kit for automated genotyping contg. pairs of PCR primers - deamplify polymorphic nucleotide repeat sequences, arranged in with a characteristic fluorescence label, useful e.g. in deta

                                                                                                                                                                                                                   polymorphic, simple sequence repeats and can be used in automated genotyping. esp. fluorescence-based. The primers correspond to the unique genotyping. esp. fluorescence-based. The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (ie. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 6 primer pairs are shown in AAQ95639-686. The published size range of the DSS413 allele is 264-276 bp, and the degree of heterozygosity in the population is
                                                                                                                                                                                                                                                                                                                                                                                                                           The method aims to provide a collection of highly reproducible microsatellite marker sequences (MMS) at approx. 10-50 cM intervals throughout the human genome which can be detectably labelled. The M

Adeno:viral vector for gene therapy of cancer or bone marrow purging contains two ClaI restriction sites to increase chance of generating fully cut DNA, thus reducing the parental genomic background.

Example 1; Page 37; 146pp; English.

AAT33529-30 are primers used to determine the absence of adenovirus Ela nucleotide sequences in an adenoviral (AdV) vector encoding for the expression of human wild-type p53 protein (AdWTp53). New Adenoviral (AdV vectors comprise: (i) an origin of replication; (ii) a left inverted terminal repeat; (iii) a nucleotide sequence of the AdV genome contg. 2 Clal sites, one at the 5'-end; and (iv) a homologous recombination domain. AdV vectors which also contain heterologous DNA and regulatory sequences, are used to inhibit cell proliferation (including abnormal vascularisation), esp. to treat human melanoma, breast or lung tumours, sarcoma and carcinoma, including forms resistant to drugs. The vectors are also used to treat subjects at risk of such cancers, and to purge (AdV)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           probes were synthesised based on single point mutations at codon 49. After PCR amplification of nucleic acid samples using specific primer pairs, these probes can be used to detect Gs(alpha) mutations associated with oncogenesis. See AAQ13431-Q13542. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                        Total mRNA, is extracted from the seeds, leaves and roots of pokeweed and used to prepare cDNA using PCR. The resultant cDNA is used to prepare two DNA fractions, which are introduced into a cloning vector EMBL3 and then into host E.coli pLK-17 (P2) to produce PAP. PAP has a similar activity to ricin, i.e. inhibits protein synthesis. The protein may be obtained all year round by recombinant DNA techniques. PAP can be used partic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequences (AAQ53077-Q53136) are used in the invention to detect specific genes without the use of radio-isotopes. Detection is carried out by hybridisation of denatured (ss) sample DNA with a (ss) nucleic acid probe, complementary to the target sequence. Hybridisation occurs on the surface of an electrode or optical fibre and detection is visualised by the addition of an entity that recognises (ds) hybridised DNA and is electrochemically / photochemically active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detection method of gene without using radio-isotope - by hybridi of nucleic acid probe which is single strand having complementary sequence of gene and single strand denatured sample DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gene detection; radio-isotopes; target gene; electrode; detection; optical fibre; hybridise; hybridisation; electrochemical; photoche electrolysis; probe; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the antibody specifically reacts with an epitope generated and/or formed by the mutation in the voltage-gated chloride channel CIC-2; (6) an CC aptamer specifically binding to (1) or to the polypeptide of (4); (7) a CC primer or pair of primers capable of specifically amplifying (1); (8) a CC composition comprising (1), the vector of (1), the primer or pair of primers composition comprising (1); the vector of (1), the primer or pair of primers of (6) and the primer or pair of primers (CC of (7); (9) a method of diagnosing a neurological disease or a CC susceptibility to a neurological disease; (10) a pharmaceutical CC disease; (12) a kit comprising (1); the vector of (1), the bost of (2), CC the polypeptide of (4); the antibody of (5), the aptamer of (6) and the primer or pair of primers of (7); (13) a method of identifying or composition or pair of primers of (7); (13) a method of identifying or composition or pair of primers of (7); (13) a method of identifying or cc screening for molecules capable of specifically interacting with the CC polypeptide of (4); (14) a method of characterising molecules capable of altering the characteristic of the polypeptide of (4); and (15) a method of producing a pharmaceutical composition. (1) has neuroprotective and CC polypeptide, antibody, aptamer and the primer or pair of primers from the present invention can be used in preparing a diagnostic or pharmaceutical composition for the detection and treatment of a neurological disease or composition for the detection and treatment of a neurological disease or composition for the detection and treatment of an envelopment of primers or pair of primers from the present sequence represents a PCR primer for the human CICN-2 gene, which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches 16;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (5)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               located on chromosome 3, more specifically to 3q26. Also described: (1) evector comprising (1); (2) a host transformed with the vector of (1) or transformed with (1); (3) a method to from the polypeptide encoded by (1) a polypeptide encoded by (1) produced by the method of (3); (5) an antibody specifically directed to the polypeptide of (4), where the antibody specifically reacts with an epitope generated and/or formed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a nucleic acid molecule (I) comprising sequence encoding a polypeptide which has an amino acid sequence of a voltage-gated chloride channel CIC-2, where the glycine (Gly) residue corresponding to position 715 of the wild-type voltage-gated chloride channel CIC-2 comprising a 898 mmino acid residue. The voltage-gated chloride replaced by another amino acid residue. The voltage-gated chloride channel CIC-2 is encoded by the CICN2 gene. The human CICN2 gene is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ADQ27097 standard; DNA; 19 BP

                                                                                                                                                                                                                                       The invention relates to a method of detecting the base sequence for RNA interference by detecting the regions in the DNA sequence fulfilling the following requirements such as: (i) the base at 3' terminal is adenine, thymine or uracil; (ii) the base at 5' terminal is guanine or cytosine; (iii) the seven base sequence at 3' terminal is rich in adenine, thymine and uracil, and; (iv) there are bases in a such a number that it causes RNA interference without showing cytotoxicity. The method is used for designing and synthesizing sirNA causing RNA interference. This sequence corresponds to an RNA interference target sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (SAIG/)

25-MAR-2003 05-NOV-1991 Synthetic. Gs(alpha)-49; Probe to mutant codon 49 (GAA) AAQ13434; 07-FEB-1990; 07-FEB-1990; 22-AUG-1991 WO9112343-A WPI; 1991-267154/36. (CETU) CETUS FP, (revised) (first entry) CORP. point mutation; oncogenesis; Lyons 90US-00477260 90US-00477260 ĮĘ, of G-protein alpha subunit. PCR; tumour; ss

Method for detection of point mutation(s) in nucleic acid segments where segments encode GTP binding protein or sub-unit and method is amplification followed by sequence-specific probe hybridisation.

involves

This probe corresponds to a mutant version of codon 49 (wild-type = GGAP). This codon is a potentially oncogenic site and a group of mutant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             involves determining the amount of expression of an interferon-associated gene in cancer cells or virus-infected cells. The invention also relates to drug compositions for the treatment of cancer and viral diseases containing interferon-alpha together with a cyclooxygenase-2 (Cox-2) inhibitor such as indomethacin which potentiates the apoptosis induction effect of the interferon. The method and compositions of the invention are useful in the treatment and prevention of cancers (e.g., cancer of the colon, lung, pancreas, breast, stomach, liver, kidney, nerve cell, skin, muscle, uterus and throat) and viral infections (e.g., hepatitis B and of the preventions and throat) and viral infections (e.g., hepatitis B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             skin, muscle, uterus and throat) and viral infections (e.g., hepatitis and C). The present sequence represents a PCR primer used in real-time PCR to determine the amount of expression of an interferon-associated gene in cancer cells cultured in the presence of interferon-alpha.

                                                                                                                                                       The present invention describes a composition which comprises a therapeutic agent that reduces the amount of active heat shock protein 27 (hsp27) in hsp27 expressing cells exposed to the therapeutic agent. The composition has cytostatic activity, and can be used in gene therapy. The composition is useful in treating cancer, e.g., prostate, bladder, lung, breast, pancreatic, colon, skin (for example melanoma), renal or ovarian cancer or a central nervous system malignancy. The present sequence represents a human hsp27 short interfering RNA (siRNA) oligonucleotide which is used in the exemplification of the present invention.
                                                                                                                              Sequence 19 BP;

                                                                                                                                                                                       deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the TGFb-R gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating diabetic nephropathy, chronic liver disease or pulmonary fibrosis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TGFb-R-targeted double-stranded siNA, which is identical to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   20-FEB-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human transforming growth factor beta (TGFb) receptor (TGFb-R) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New short interfering nucleic acid, useful e.g. for treatment and diagnosis of diabetic nephropathy, which downregulates expression transforming growth factor-beta receptor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      pharmacogenomics; gene function analysis; gene mapping; human; antidiabetic; nephrotropic; hepatotropic; cytostatic; transforming growth factor beta receptor; TGFb; TGFb-R; diabetic nephropathy; chronic liver disease; pulmonary fibrosis;
                                                                                                                                            Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mcswiggen

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a goldfish testis development factor, Tdf2 (ADM82158) and cDNA encoding it (ADM82157). Tdf2 has homology with Japanese eel 28kDa-le apolipoprotein (GenBank accession number BAB40965 Tdf2 plays an important role in sex differentiation, male gonad development and in the regulation of reproduction. Sequences ADM82161-ADM82162 represent goldfish Tdf2 reverse transcription-PCR (RT-PCR)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gene sequence and use of fish testicle development factor

                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                              á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to short interfering nucleic acids (siNA) which CC downregulate expression of the human tumour necrosis factor (TNF) CC receptor gene by RNA interference. The siNAs may not comprise CC ribonucleotides and may be double or single stranded. They further CC asense oligonucleotide and antisense regions, or alternatively are assembled from CC asense oligonucleotide and an antisense oligonucleotide. Specifically, CC the siNAs include short interfering RNA (siRNA), double-stranded RNA, CC micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be cummodified or chemically modified, can contain deoxyribonucleotides, and CC can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in CC vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the TNF receptor gene in cells, tissue explants or organisms (e.g., by ex vivo CC gene therapy), or in grafts and transplants for the treatment of a CC variety of conditions. The TNF receptor siNAs have antibacterial, cc and antilnfammatory activities. They may be used for treating septic and antilnfammatory activities. They may be used for treating septic conditions the transplants for drug screening, CC diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence arranded at NA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                           further comprise sense and antisense regions, or alternatively are casembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits cor the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the TGFD-R gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cliber disease or pulmonary fibrosis. The siNAs are also useful for drug screening, diagnosis, therapeutic target dientification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TGFb-R-targeted double-stranded siNA.

The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification;

                                                                                                        밁
                                                                                                                                                                                                                                                                                                                               Cribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from CC asense oligonucleotide and an antisense oligonucleotide. Specifically, CC the sinAs include short interfering RNA (siRNA), double-stranded RNA, CC micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be CC unmodified or chemically modified, can contain deoxyribonucleotides, and CC can be chemically synthesised, expressed from a vector or enzymatically conjugates and/or complexes of siNAs can be ctate express siNA. The siNAs are used to modulate expression of the TNF receptor gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a CC variety of conditions. The TNF receptor siNAs have antibacterial, cand antiinflammatory activities. They may be used for treating septic shock, rheumatoid arthritis, HIV/AIDS, psoriasis, inflammation and candinate densing, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence corpresents the upper strand of a human TNF receptor transcript target

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 335 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polynucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                short interfering nucleic acid; siNA; breakpoint cluster region; v-abl Abelson murine leukaemia viral oncogene homologue 1; BCR-A cytostatic; leukaemia; lymphoma; human; ss; slRNA; ABL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New double-stranded interfering nucleic acid, useful e.g. and diagnosis of leukemia and lymphoma, downregulates the cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mcswiggen J,

The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I and II; a wide range of tumours, and inflammatory diseases (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK siNA which is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              05-SEP-2002; 2002US-0408378P.

antiasthmatic, immunosuppressive, antibacterial, antirheumatic, antipscriatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I and II; a wide range of tumours, and inflammatory diseases (asthma, septic shook, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK siNA which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   20-FEB-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 1398
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or organisms by introduction of slNA; (2) kits for in vitro or in vivo delivery of slNA; (3) conjugates and/or complexes of slNA; and (4) vectors that express siNA and cells containing these vectors. MAPK siNAs have cytostatic, anorectic, antidiabetic, antiinflammatory, antiarthritic, anorectic, antidiabetic, antiinflammatory, antiarthritic, antipsoriatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I eptic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target identification and validation, genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK siNA which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

antiasthmatic, immunosuppressive, antibacterial, antirheumatic, antipsoriatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types and II; a wide range of tumours, and inflammatory diseases (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK siNA which is use in the exemplification of the present invention.
                                                                                                                                                                                                                                that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA and cells containing these vectors. MAPK siNAs have cytostatic, anorectic, antidiabetic, antiinflammatory,
                                                                                                                                                                                                                                                                                                                                                               The present invention describes a short interfering nucleic
                                                                                                                                                                                                                                                                                                                                                                                                   Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                  New short interfering nucleic acid, diagnosis of cancer, downregulates

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD cenes in cells it is an explant can be used to modulate expression of SCD cenes in cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a short interfering nucleic acid (sin that downregulates expression of the SCD (stearoyl-CoA desaturase) ge by RNA interference. Also described: (1) modulating expression of SCD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New short interfering nucleic acid, useful e.g. for treatment and diagnosis of obesity or diabetes, downregulates expression of the stearoyl-CoA desaturase gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             29-JAN-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ADE27435;
      New short interfering nucleic acid, useful e.g. for treatment

Example 3;
                                                                                          diagnosis of obesity or diabetes, downregulates expression of stearoyl-CoA desaturase gene.
                                                                                  SEQ ID NO
                                                                                 379; 139pp;
                                                                                 English
```

genes, in cells, tissue explants or organisms, e.g. for treating obesity diabetes (types I and II); afteroscleroscls; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is used in the exemplification of the present invention. by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of siMA; (2) kits for in vitro or in vivo delivery of siMA; (3) conjugates and/or complexes of siMA, and (4) vectors that express siMA. SCD inhibiting siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD that present invention describes resent invention describes a short interfering downregulates expression of the SCD (stearoyl-(stearoyl-CoA desaturase) nucleic acid (siNA) obesity;

                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) ar LRP6 mutants, which results in a HBM-like phenotype when expressed in cell. The HBM-like phenotype results in bone mass modulation and/or lilevel modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present PCR primer was used to illustrate the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) ar LRP6 mutants, which results in a HBM-like phenotype when expressed in cell. The HBM-like phenotype results in bone mass modulation and/or lile level modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence is a Sequence Tagged Site (STS) marker, which was used to prepare a physical map of the Zmax1 (LRP5) greaters.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid comprising a mutation in LRP5 or LRP6, useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antiarteriosclerotic; cytostatic; virucide; obesity; diabetes;
atherosclerosis; cancer; viral infection; drug screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    stearoyl-CoA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Stearoyl-CoA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ADE27145 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                       13-FEB-2003; 2003WO-US004317

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel transgenic animals expressing the high Co bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRP5 or LRP6, or expressing an LRP5 that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are for the study of bone density modulation or bone mass modulation. The invention has osteopathic and cytostatic activity. The polynucleotides of the invention may have a use in gene therapy. The transgenic animals and nucleic acids are for the study of bone density modulation, where the species in more than one parameter selected from bone density, bone strength, trabecular number, bone size, or bone tissue connectivity. The transgenic animals, mucleic acids and methods are useful for identifying conjustions, which may be employed for treating or preventing bone diseases, e.g. osteoporosis, osteomalacia, rickets, Pager's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, or characterised by reduced bone density or mass. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

by homologous or non-homologous recombination. The transgenic animals are control for the study of bone density modulation or bone mass modulation. The cinvention has osteopathic and cytostatic activity. The polynucleotides of the invention may have a use in gene therapy. The transgenic animals and nucleic acids are for the study of bone density modulation, where the bone mass is modulated relative to non-transgenic animals of the same species in more than one parameter selected from bone density, bone transgenic animals, nucleic acids and methods are useful for identifying transgenic animals, nucleic acids and methods are useful for identifying compositions, which may be employed for treating or preventing bone compositions, which may be employed for treating or preventing bone compositions, osteoporosis, osteomalacia, rickets, Paget's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, or characterised by reduced bone density or mass. The present sequence is used in the exemplification of the invention

                                                                                                                                                                                                                                             The invention relates to a method for identifying a molecule involved in lipid regulation comprising identifying a molecule that binds to or inhibits binding of a molecule to high bone mass (HBM) or its wild type gene, Zmaxi. Compounds identified by the method are useful for treating, diagnosing, preventing or screening for normal and abnormal lipid-associated conditions, including arterioselerosis, cardiovascular disease, stroke, and osteoporosis. The compounds may also be used in the treatment or prevention of diabetic atherosclerosis, neurovascular conditions caused by plaque build-up, poor circulation due to plaque build-up and associated poor wound healing. The methods may be used in gene therapy, pharmaceutical development, and diagnostic assays for bone development disorders. Molecules identified by comparison of Zmaxl and
                                                                                                                                                                 HBM systems can be used as surrogate markers in pharmaceutical development, in diagnosis of human or animal bone disease, and in the treatment of bone diseases. Sequences ABK22776-ABK23411 represent cDNA molecules encoding human Zmax1 and HBM, and PCR primers, probes, linkers and adapters of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; mouse; Zmax1; HBM; high bone mass gene; lipid regulation; stroke; lipid-associated condition; arteriosclerosis; cardiovascular disease; ss; osteoporosis; atherosclerosis; diabetic atherosclerosis; plaque build-up; neurovascular condition; wound healing; gene therapy; PCR primer; probe; bone development disorder; antiarteriosclerotic; cardiovascular; osteopathic; cerebroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying molecules involved in lipid regulation, useful for diagnosing, treating or preventing e.g., arteriosclerosis, compidentifying a molecule that binds to high bone mass gene or its corresponding wild type gene.

                                                                                                                                                                                                                                                                                                                                                                   present DNA sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                   The invention comprises 42 gene sequences which were found to be differentially methylated in pancreatic cancer. The DNA sequences of tinvention are useful in detecting cellular proliferative disorders in patient. The DNA sequences of the invention are useful for cancer

                                                                                                                                                         The present invention relates to viral vectors comprising a nucleic acid sequence encoding retinoic acid receptor beta-2 (RARbeta2). The vector is preferably based on or derived from a lentivirus, more preferably nongrises deleted regions of the gag-pol genes. The vector may be engineered to replace all or part of the env gene with env sequences from other RNA viruses (e.g. gene encoding vesicular stomatitis virus g, VSV-G protein), by a method of pseudotyping, to broaden the infectious spectrum of the viral vector. The viral vectors of the invention are useful in the preparation of a medicament, or in gene therapy to stimulate neurite development, or for the treatment of a neurological disorder (e.g. Parkinson's disease and spinal cord injuries). The vectors are also useful for treating cancers, inflammatory disorders, ulcers, lateral vectors, autoimmune disorders, cardiovascular disorders, ulcers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Viral vector; retinoic acid receptor beta-2; RARbeta2; gag-pol; env; non-primate lentivirus; equine infectious anaemia virus; EIAV; cancer; vesicular stomatitis virus G protein; VSV-G; neurite development; neurological disorder; inflammatory disorder; dermatological disorder; autoimmune disorder; cardiovascular disorder; nerve growth factor; NGF;
                                                 haemophilia, liver cirrhosis, bone marrow transplantation or other transplantation complications. The vectors eliminate the need for administration of nerve growth factor (NGF) to a subject, enable neurite outgrowth to be promoted in adult neural tissue, and enable RARbeta2 to be introduced into non-dividing mammalian cells such as neuronal cells. The present sequence represents a primer used in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel viral vector useful in preparation of medicament to cause neurite development or for treatment of neurological disorder, comprises a sequence encoding a receptor, preferably retinoic acid receptor beta-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      30-MAR-2000;

                                                                                                                                                                                                                                                                                          The invention relates to an isolated TRC8 (Translocation in Renal cancer from Chromosome 8) nucleic acid molecule, encoding a polypeptide comprising a sequence of 664 amino acids fully defined in the specification and comprising a sequence located in the 5 flanking region to the coding region of TRC8 and a sequence which occurs in certain sporadic renal cell carcinomas. The methods are useful for detecting the presence of the TRC8 gene in a biological sample, detecting alterations to the gene, such as a 3;2 human chromosomal translocation, and fused DNA containing the fused site of TRC8/FIT. A nucleic acid probe is useful for detecting the 3;8 human chromosomal translocation, by contacting the nucleic acid probe with a biological sample to be tested, and determining whether the nucleic acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically hybridies to the TRC8/FIT or put 1/2/PDC8 fixed acid probe specifically h

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; antipsoriatic; dermatological, antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological, keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57577 to AAH62099 represent sequences used in the exemplification of the present invention
                            ribozyme (I) which cleaves RNA encoding a cytokine involved inflammation, matrix metalloproteinase (MMP), cyclin, cell-c dependent kinase, growth factor or a reductase, or administed
                                                                                                                                                                                                                                                                     Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                       The present
                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2001-300427/31.

The present invention describes the human Zmax1 gene and the high bon mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 and i genes have osteopathic activities. The genes can be used in gene therapy and in the production of vaccines. They can be used the diagnosis and treatment of bone disorders including osteoporosis, Paget's disease, sclerostosis, osteomalacia and fibrous dysplasia.

(I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antistickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scarr. AAH57577 to AAH62099 represent sequences used in the

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding a hormone-sensitive lipase (HSL) or a splice variant of HSL. The compound specifically hybridises with and inhibite the expression of HSL or a splice variant of HSL, or specifically hybridises with at least an 8-nucleobase portion of an C active site on a nucleic acid molecule encoding HSL. (I) have anorectic, and cities and cytostatic activities, and can be used in antisense consequence of having an abnormal metabolic condition such is obesity, concer (e.g. pituitary, colorectal, breast, testicular, pulmonary or concer (e.g. pituitary, colorectal, breast, testicular, pulmonary or colorects, particularly plasma or serum glucose levels, in a diabetic confinal. The present sequence represents a human hormone-sensitive lipase chimeric phosphorothioate antisense oligonucleotide, which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ABZ82677

                                                                                                                                                                                                                                                                                          The specification describes an insulin-secreting cell, comprising a pancreatic cell transfected with islet duodenal homeobox-1 (IDX-1) cDNA and cultured in glucagon-like peptide-1 (GLP-1). The cell exhibits a dose dependent response of insulin secretion when exposed to glucose. The insulin-secreting cells and cell lines are useful for investigating the function and development of pancreatic cells, to test the efficacy of drugs that stimulate insulin secretion, or to develop new approaches to treat diabetes. PCR primers ABZ77624-25 were used to amplify a fragment of the GLUT2 gene. The primers were used to test the effect of GLP-1 on

                                                                                                                                                                                                                                                                                                                                              junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of an antiinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine of lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
